

WIRING DIAGRAM

Adding a Cut Off Switch

IMPORTANT!

The fuse holders, ON/OFF switch and battery connection wires be sized appropriately to handle the maximum circuit amperage.

This is an example showing the placement of an On/Off switch to shut off power going to the LED controller from the power source. It stops the controller from draining the battery when not in use. Typically used in situations where the vehicle is going to be stored for a period time. Most commonly used on vehicles that only have one battery such as motorcycles, cars and golf carts.

Note that adding an ON/OFF switch only turns power on/off to the controller. You still need to use the RF wireless remote/Bluetooth to operate the lights attached to the controller.
